

Internship Job Analytics Dashboard

Objective

Build an interactive Tableau dashboard to analyze internship opportunities using filters and visualizations.

Dataset Description

Dataset contains internship/job postings with company, salary, work type, company size, qualifications, country, experience, role, job portal, preference and posting date.

Tools Used

Tableau Public, Excel/CSV.

Dashboard Screenshots

Internship Dashboard

Task 1 Dashboard

Task 1: Preference vs Work Type

Objective:
Analyze the relationship between job preference and internship work type by applying salary and company size filters.

Applied Filters:
Work Type = Intern
Company Size < 50,000
Salary > \$9,000

Observation:
The visualization compares internship opportunities across different preference categories after applying all required filters. Female preference has the highest number of internship postings, followed by Both and Male, providing insight into the distribution of internship opportunities across preference groups.

Task 2 Dashboard

Task 2: Company Size vs Company Name

Objective:
Analyze the relationship between **Company Size** and **Company Name** using a scatter plot after applying the specified filtering conditions.

Applied Filters:
Company Size < 50,000
Job Title = Mechanical Engineer
Experience > 5 Years
Salary > \$50,000
Work Type = Full-Time or Part-Time
Preference = Male
Excluded Asian countries except those starting with "I"
Job Portal = Idealist
Company Name contains at least two vowels

Observation:
After applying all required filters, only **one company** satisfies the specified conditions. Therefore, the scatter plot displays a **single data point**, indicating that only one matching record exists in the dataset.

Note:
The task specifies that the visualization should only be visible between **3 PM and 5 PM IST**. However, the provided dataset does **not** contain any **Time** field or **timestamp**. Therefore, this condition could not be implemented in Tableau and has been documented as a dataset limitation.

Task 3 Dashboard

Task 3: Work Type Salary Distribution

Objective:
Analyze the salary distribution of internship job postings using a **box-and-whisker plot** after applying all specified filtering conditions.

Applied Filters:
Work Type = Intern
Latitude < 10
Company Size < 50,000
Salary > \$8,000
Job Title is a single word (less than 10 characters)
Experience is an even number
Job Posting Date between **01-01-2021** and **31-12-2023**
Contact Person name contains the letter "e"

Observation:
The box-and-whisker plot shows the distribution of salaries after all required filters were applied. Most matching internship postings are concentrated around the lower salary range, while a few postings have substantially higher salaries, indicating the presence of high-value salary outliers. This visualization provides a clear summary of salary spread, median, and variation within the filtered dataset.

Note:
The task requires the visualization to be displayed only between **3 PM and 5 PM IST**. Since the dataset does **not** include a **Time** column or timestamp information, this requirement could not be applied. The visualization was created using all other specified filtering conditions.

Task 4 Dashboard

Task 4: India vs Germany Job Comparison

Objective:
Compare job postings between **India** and **Germany** using a stacked bar chart after applying the required filtering conditions.

Applied Filters:
Qualification = B.Tech
Work Type = Full-Time
Experience > 2 Years
Role = Data Scientist / Art Teacher / Aerospace Engineer
Salary > \$10,000
Job Portal = Indeed
Company Name has more than 8 characters
Location is not empty
Country = India and Germany

Observation:
After applying all required filters, only **Germany** contains a matching job posting, while **India has no records** satisfying the specified conditions. As a result, the visualization displays a single bar for Germany. This indicates that no Indian job postings met all filtering criteria simultaneously in the available dataset.

Task 5 Dashboard

Task 5: Top 10 Companies Treemap

Objective:
Identify the **Top 10 companies** hiring for **Data Engineer** roles with the **Job Title = Data Scientist** using a treemap after applying all specified filtering conditions.

Applied Filters:
Role = Data Engineer
Job Title = Data Scientist
Qualification = B.Tech
Preference = Female
Job Portal = LinkedIn
Company Size ≥ 10,000
Excluded Asian countries and countries starting with "C"
Contact Person name ends with a vowel
Job Posting Date between **01-01-2023** and **06-01-2023**

Observation:
No companies were displayed in the treemap after applying all the required filters.

Reason:
The dataset does not contain any records that satisfy **all** the specified filtering conditions simultaneously. In particular, the required **Job Posting Date range (01-01-2023 to 06-01-2023)** returns **zero matching records**, resulting in a blank treemap. This behavior correctly reflects the available data rather than an error in the visualization.

Note:
The task requires the visualization to be displayed only between **3 PM and 5 PM IST**. Since the dataset does **not** include a **Time** column or timestamp information, this requirement could not be applied. The visualization was created using all other specified filtering conditions.

Task 6 Dashboard

Qualification Drilldown Map

Task 6: Qualification Drilldown Map

Objective:
Create a drilldown map showing job postings in African countries based on the specified qualification, work type, salary, company size, and contact person conditions.

Applied Filters:
Country = African Countries
Qualification = B.Tech / M.Tech / PhD
Work Type = Full-Time
Job Title starts with "D"
Preference = Male
Company Size > 80,000
Salary > \$20,000
Contact Person starts with "A"
Job Portal = Indeed

Observation:
No locations are displayed on the map after applying all the required filters.

Reason:
The dataset does not contain any records that satisfy all the specified filtering conditions simultaneously. After applying the **Job Portal = Indeed** filter along with the other required conditions, **zero matching records** remain. Therefore, the map is blank, which correctly represents the filtered dataset rather than a visualization error.

Note:
The task requires the visualization to be displayed only between **3 PM and 5 PM IST**. Since the dataset does **not** include a **Time** column or timestamp information, this requirement could not be applied. The visualization was created using all other specified filtering conditions.

(All)

Task 1: Preference vs Work Type

Analyzed internship preferences by work type after applying salary and company size filters.

Task 2: Company Size vs Company

Compared company size and companies using a scatter plot. The dataset has no timestamp field, so the 3 PM–5 PM IST condition could not be applied.

Task 3: Work Type Salary Distribution

Analyzed salary distribution using a box-and-whisker plot. The dataset has no timestamp field, so the 3 PM–5 PM IST condition could not be applied.

Task 4: India vs Germany Job Comparison

Compared internship opportunities between India and Germany using the required filters.

Task 5: Top 10 Companies Treemap

Applied all required filters. No matching records were available for the specified conditions.

Task 6: Qualification Drilldown Map

Analyzed qualification-based geographic opportunities. No matching records remained after all required filters.

Key Findings

- Interactive filters allow exploration of internship data.
- Strict filtering may result in zero matching records.
- The dataset does not contain time information required for 3 PM–5 PM IST filtering.

Conclusion

The project successfully demonstrates internship data analysis through interactive Tableau dashboards while documenting dataset limitations.
